Real Systems

Urban Air: Inferring and Forecasting Fine-Grained Air Quality using Big Data (2013-)

A system that infers the real-time and fine-grained air quality throughout a city, based on historical and real-time reports from a limited number of existing air quality measurement stations and other data sources reflecting city dynamics: meteorology, traffic flow, human mobility, structure of road networks, and points of interests. Urban Air also forecasts fine-grained air quality over the next 48 hours. The system also suggests the number of measurement stations that a city needs and candidate locations for building new stations. Urban Air has been deployed with the Ministry of Environmental Protection of China, providing fine-grained air quality information for over 70 Chinese cities.

CityNoise: Diagnose Urban Noises using Big Data (2013-)

The project aims to diagnose a city's noise pollution with crowdsensing and ubiquitous data. It reveals the fine-grained noise situation throughout a city and analyzes the composition of noises in a particular location, by using 311 complaint data together with road network data, points of interests, and social media.

T-Share: A large-Scale Dynamic Taxi Ridesharing Service (2012-2013)

T-Share is a large-scale dynamic taxi-sharing system that accepts passengers' real-time ride requests sent from smart phones and schedules taxis to pick up via ridesharing, subject to time, capacity and monetary constraints. The system yields significant social and environmental benefits. Compared with traditional non-ridesharing, *passengers* pay less and get a higher chance of being served; *taxi drivers* earn more money; *governments* save energy consumption and reduce the emission of air pollutants.

T-Drive: Driving Directions Based on Taxi Trajectories (2009-2011)

T-Drive is a navigation system providing personalized driving directions that adapt to weather, traffic conditions, and your own driving habits. The system uses GPS data from taxicabs to gather information about both real-time and past traffic conditions. It also gleaned the weather from publicly available websites. The system uses these datasets to predict what traffic conditions a driver is likely to encounter upon arriving at various points on a path and to adjust the directions accordingly.

T-Finder: A Passenger-Cabbie Recommender System (2010-2012)

T-Finder is a recommender for taxi drivers and people expecting to take a taxi, using the knowledge of 1) passengers' mobility patterns and 2) taxi drivers' pick-up behaviors learned from the GPS trajectories of taxicabs. First, this recommender provides taxi drivers with some locations (and the routes to these locations), towards which they are more likely to pick up passengers quickly (during the routes or at the parking places) and maximize the profit. Second, it recommends people with some locations (within a walking distance) where they can easily find vacant taxis.

GeoLife: Building Social Networks using Human Location History (2007-2010)

GeoLife is one of the first location-based social-networking services. It enables users to share life experiences and build connections among each other using human location history. By mining many users' location histories, GeoLife discovers the top most interesting locations, classical travel sequences, and travel experts. By understanding individual location history, GeoLife measures the similarity between users and perform personalized friend & location recommendation.
